

Even if

***your dog never leaves
the relative safety of your back yard,
it is still possible for you
to bring the virus home on your shoes,
your clothing or even on the tires of your car etc.***

***Along with getting your dog vaccinated from your veterinarian
You also need to:***

De-contamination & Disinfection

It's important to know that the parvovirus itself is extremely hardy and difficult to 'kill'. It can live on multiple surfaces and in the ground for a long period of time.

- **Outdoors-**

When in the soil, canine parvovirus is not dramatically affected by heat, rain, cold, frost or any other climatic condition. If the ground is frozen it basically puts the virus into a 'dormant' state and when the ground thaws there is still a risk of contamination.

If you don't treat/disinfect the ground, this is what you can expect....

Areas in direct sunlight: contamination lasts approx. 5 - 6 months

Areas in shade: contamination lasts approx. 7 - 8 months

- **Indoors-**

Parvovirus becomes inactive much more quickly indoors than it does outside. Normally contamination will last for approx. 1 month inside your home.

Five Star Services can help you!

- ☑ **We provide parvovirus yard and outdoor treatments.**
- ☑ **We disinfect all the grassy and yard areas.**
- ☑ **We disinfect all outdoor kennel areas.**
- ☑ **We disinfect all dog toys, food and water dishes.**
- ☑ **We disinfect all concrete pads that the dog can contact with.**
- ☑ **We completely clean all dog houses and disinfect them.**
